

# Bowline

The bowline is used to put a non sliding loop at the end of a rope. To tie the bowline first make a bight a little larger than the size loop you want. Then at the top of the loop form a small overhand loop. Then the working end goes up through the overhand loop (*the rabbit comes out of his hole*) and wraps around the standing part of the rope (*the rabbit goes around the tree*). To finish the knot the working end goes down through the overhand loop (*the rabbit goes back down his hole*).
